

# eDVIR INTEGRATION

## Streamline fleet maintenance

At Penske, we provide you with practical ways to maximize uptime, ensure compliance and remain a step ahead of your maintenance demands.

We work with multiple telematics providers to extend the use of telematics data to Penske. One example is through our eDVIR integration that streamlines the request for repairs, based on defects found during inspections.

### HOW THE eDVIR INTEGRATION WORKS

This integration enables the automatic reporting of any defects found during pre- and post-trip DVIRs. Requests for service for DVIR defects are sent automatically from your telematics platform to Penske's maintenance system. As defects are resolved, the resolution status is communicated back to your telematics platform with detailed mechanic notes. Information such as repair shop location, repair notes and contact details are made available.

Through this integration, Penske can:

- Prioritize critical issues and defects
- Complete necessary repairs
- Clear defects

You benefit from faster issue identification and resolution and less paperwork, all while saving you and your drivers time. Plus, the confidence that your vehicles are well maintained and compliant.

### THE POWER OF PENSKE BUILT AROUND YOU

We provide the experience of working with thousands of customers to navigate more OEMs and providers than anyone else. That industry-wide perspective helps us create innovative programs like this eDVIR integration that helps you extend the use of your telematics data.
